ABSTRACT OF THE DISCLOSURE

A production of a plastic closure which is essentially a question of cost. Plastic closures with lower parts and covers that are joined to each other by a snap hinge can be manufactured in a particularly advantageous manner if the covers and lower parts are produced in a closed state. According to this invention, the closure is structured so that all the elements of the snap hinge are arranged in the covering wall areas of the closure, which extend in a parallel manner in relation to the direction of movement in which the injection mold is opened and closed. Thus, the cycle times are extremely short and the injection molds can be economically produced.
